PRESENTER SCRIPT · FRIDAY, NOVEMBER 6, 2026

Your team has AI. Why is the work still manual?

30-minute webinar · 1:00-1:30 PM ET
Suuchi Ramesh opens. Josh Lee hosts, drives the demo and closes.

The through-line: Employees can get real value from AI while useful methods stay local, other people struggle, and someone still coordinates the work by hand.

Elapsed	Lead	What happens
00:00-02:00	Suuchi	Welcome, theme and handoff to Josh
02:00-05:00	Josh	Dana, research, company graph and Daniel
05:00-09:00	Josh	Priya, Ben and Nina: useful local successes
09:00-12:00	Josh	Ava, Elena and Marcus: different needs
12:00-16:00	Josh + Suuchi	Leah, Dana's brief and three discoveries
16:00-20:00	Josh	Build 1: branch workflow. Build 2: tracker.
20:00-23:00	Josh + Suuchi	Build 3: reviewed finding. After graph.
23:00-25:00	Josh + Suuchi	Assessment, build plan and invitation
25:00-29:00	Both	Audience questions
29:00-30:00	Josh	Close and next step

Before going live: Open the demo at Page 1, use Presenter controls > Restart, and share the browser window at 100% zoom. Keep this script on a separate screen. Use the numbered navigation to jump between sections; use the employee strip to switch people. Click once, then pause so the audience can see the result.

Live demo: webinarnine67.vercel.app/live.html
Reading key: Speaker labels are spoken copy. Blue boxes are Josh's operating cues. Timing includes clicks and pauses.

00:00-02:00 · SUUCHI OPENS

Start with something they recognize.

On screen: Page 1, Dana’s view. Josh is already sharing the demo.

SUUCHI Welcome, everyone. I’m Suuchi Ramesh, and I’m here with Josh Lee from Nine-67. Thank you for joining us.

SUUCHI Today’s question is simple: your team has AI, so why is so much of the work still manual?

SUUCHI In many companies, the answer is not that AI is failing. Somebody has figured out a brilliant way to use it. Somebody else uses the same tool mainly to rewrite emails. Another employee tried it, got an unhelpful answer, and went back to the spreadsheet because a deadline was coming.

SUUCHI Meanwhile, someone still has to collect the updates, work out what they mean together, and get the right information to the next person.

SUUCHI We’re going to show you those different experiences inside one fictional company. As you watch, think about your own team. Who has built something useful that other people have never seen? Who wants help but does not know where to start? Who still spends Friday chasing answers?

SUUCHI Josh will run most of the demonstration. Then we’ll show three different improvements Nine-67 could build, explain where an engagement starts, and leave time for your questions. Please put questions in the chat as we go.

SUUCHI Josh, take us inside the company.

JOSH Thanks, Suuchi. This is Parkside, a fictional company with 150 employees. Everyone has a company Copilot license. These are illustrative workspaces and simulated workflows, so we can focus on the work without touching anyone’s real data.

Delivery: warm and conversational. Suuchi should finish by 02:00. Josh controls the browser throughout; no screen-sharing handoff is needed.

02:00-05:00 · PAGES 1, 2 AND 3

Confidence, evidence, then the people.

JOSH CLICKS Page 1: open Dana’s workspace. Use her single work action to reveal her Claude preparation. Then click 02 Research.

JOSH Dana is the CEO. She has good reasons to feel positive. Copilot is available to everyone. IT has launched an assistant. Sales has shown her a useful forecasting example.

JOSH And she gets real value herself. Here she asks Claude to challenge her board preparation. It raises a better question: what changed in the time it takes to finish work across departments? That helps her think. Her confidence is understandable.

02:45 · The research

JOSH The research describes this gap. In Miro’s survey, 83% agreed that AI improves individual productivity, and 69% said most AI-assisted work happens in private sessions. Atlassian found 85% using AI at work, while 29% had embedded it into workflows.

JOSH These are separate surveys, so don’t read them as one funnel. The point is that useful individual adoption can coexist with a lot of unfinished organizational work. Let’s see what that looks like.

JOSH CLICKS Click 03 The company. Leave the company graph on Today’s company. Point to the people, tools, local outputs and labeled manual handoffs. Open Daniel and use his one work action.

JOSH The same license looks different at every desk. The graph shows where work already flows and where people still export, copy or chase it. Clicking a person takes us into their actual task.

JOSH Daniel in IT built Ask Parkside. It retrieves the approved escalation procedure and its source. That is useful. But the launch message gets very little meaningful feedback. Usage tells him people opened it. It does not tell him what they achieved or where they struggled.

JOSH Now let’s look at three people who have figured out something valuable.

Research sources, with definitions and links, are on the final page. Do not describe these survey figures as Nine-67 results.

05:00-09:00 · PAGE 4

Show the work paying off.

Josh leads. One main action per employee. Let the work and the beneficiary reveal do the explaining.

JOSH CLICKS Click 04 Successes. Start with Priya. Click Show Priya’s work. Point first to the three file formats, then the saved transformation, the report and the exception review.

JOSH Priya has three branches sending files with different headers and vendor spellings. She used Claude, with sample data in her approved work account, to help develop a Power Query transformation.

JOSH Here’s the distinction: Claude helped her build the method. Excel runs the saved method. The benefit continues after the conversation ends.

JOSH The refresh standardizes the files and flags a possible duplicate. Priya reviews it. She has built something reusable, not just generated a one-time answer.

JOSH Now look at Maya at another branch. She is still cleaning a comparable file by hand. Priya’s controller sees a timely report. Maya never sees the method that could help her. This is a capability the company already has, but has not made available more broadly.

JOSH CLICKS Use the employee strip: Ben. Click Show Ben’s work. Point to the three highlighted deals and their moving dates.

JOSH Ben saves a pipeline snapshot every Friday. His review compares four weeks and flags deals whose dates keep moving without new buyer activity. He verifies the source rows, then spends his coaching time with the reps who need it.

JOSH Another manager has the same license and the same export, but starts from scratch. Ben’s invention includes the snapshots, the questions and the checks. Sharing the final forecast does not share that method.

JOSH CLICKS Employee strip: Nina. Click Show Nina’s work. Point to the grouped issues and the source evidence.

JOSH Nina’s team built a department bot. Six people use it every morning to group recurring issues and check the original cases. A service manager elsewhere still assembles a summary from those cases one at a time.

SUUCHI This is why we start by watching real work. A company-wide assessment should discover the useful things employees have already built, then work out which can be reused, supported or connected to another team.

09:00-12:00 · PAGE 5

The same access does not mean the same need.

JOSH CLICKS Click 05 Different needs. Ava opens first. Use Show Ava’s work. Point to the improved reply and the work that had to happen before it.

JOSH Ava uses Copilot frequently. It makes her reply warmer and shorter. That helps her every day.

JOSH But look at the preparation: she still has to reconstruct the customer’s history across tickets and messages before she can write a responsible answer. A high usage number would miss that. The larger opportunity is helping her find the right context.

JOSH CLICKS Employee strip: Elena. Use Show Elena’s work. Point to the vague prompt, broad advice and manual tracker.

JOSH Elena wants to use AI. She asked for help with her projects and got generic advice. With a deadline approaching, she went back to copying dates and owners.

JOSH She does not need us to tell her to be more enthusiastic. She needs a useful workflow: these notes, this tracker, these proposed changes, and a clear way to check the answer. We’ll build that in a moment.

JOSH CLICKS Employee strip: Marcus. Play the captioned practice once. Pause while the captions advance; do not click repeatedly.

JOSH Marcus practices a difficult conversation on his phone using a generic scenario. Watch the AI challenge his vague answer. He tries again and gives a clear owner and a time for the update.

JOSH That practice helps his judgment and communication. He keeps it quiet because he is unsure about the company’s expectations. Another account manager would welcome the technique. We can make the boundaries clear and share the useful practice without collecting his private chat.

SUUCHI These people need different things. Better context for Ava. A guided workflow for Elena. Clear guidance and a useful practice for Marcus. A license report cannot tell us which intervention belongs where.

Pacing: about one minute each. Do not open source drawers on this page. Leave the detailed tool and policy conversation for Q&A.;

12:00-16:00 · PAGES 6 AND 7

The work between the work.

JOSH CLICKS Click 06 Between teams. Use Show Leah’s work. Point to the inconsistent names and dates, the reconciliation, and the summary Dana receives.

JOSH Leah is the chief of staff. People can send her an update faster now. She still has to work out whether Northwind and NW Services mean the same account, which Tuesday someone means, and whether a completed task means the customer’s handoff is complete.

JOSH Her description of AI adoption is different from Dana’s: “Everyone can write me an update faster. I still have to pull everyone’s work together.”

JOSH Dana receives the polished brief and uses Claude to make sense of it. The summary can accurately say that Sales revised its forecast and Ops handled its escalations. It cannot recover a relationship that never made it into the inputs.

JOSH Nobody has to be doing a bad job for this to happen. The local tasks improved. The work of assembling the company-wide picture stayed manual.

JOSH CLICKS Click 07 Discover. Select the three discoveries in order. Keep Dana’s license-assignment comparison visible.

JOSH Sitting beside people reveals three things. First, someone already solved work another team still does manually. Second, people with the same access need very different help. Third, a department has useful findings that other teams never receive.

JOSH Suuchi, if this executive brought us in on Monday, what would we actually do?

SUUCHI We would look across the company before choosing where to build. We would speak with the sponsor and IT, watch strong users and hesitant users, and trace what happens after an AI-assisted task is finished.

SUUCHI We would identify practices worth sharing, methods worth supporting and handoffs worth connecting. Then we would prioritize with leadership and define a focused first implementation, with an owner and a way to measure whether it helps.

JOSH Let’s make that concrete with three different builds inside the same company.

16:00-20:00 · PAGE 8

Build 1 and 2: reuse a method, guide a task.

JOSH CLICKS Click 08 Build, Priya. Submit the three branch files. Exclude the duplicate after reviewing it. Publish the reviewed report. Then let Maya submit her files and review the duplicate for her own run.

JOSH For Priya, the opportunity is to make her proven method usable across branches. We document the rules, validate the input format, preserve the source references and give exceptions to a person. Priya owns the method.

JOSH Here the same invoice appears in North and East. The workflow flags it. Priya checks it before the report is published. The reviewed total is $2,050. That is a sample report total, not a savings claim.

JOSH Now Maya can run the supported workflow. We're using the same sample files so you can see the comparison. Her exception still requires review. The company can reuse the method without depending on Priya personally cleaning every file.

SUUCHI The value includes the checks and ownership. We have turned an individual success into a process another person can use and the company can maintain.

JOSH CLICKS Select Elena. Propose tracker updates. Choose Ben once to show the unresolved owner check, then choose Nina. Apply Elena's reviewed updates.

JOSH Elena needs a different build. On the left are approved meeting notes. On the right is her current tracker. The workspace proposes three specific updates and keeps the source beside each one.

JOSH It does not have enough information to silently choose a person when the note says Operations. If I choose Ben from Sales, the workflow holds the change. Elena checks the source, selects Nina and applies the reviewed updates.

JOSH She now has a useful way to do her Thursday task. The system brings the material together and proposes changes. Elena remains responsible for the uncertain decision.

These are deliberate human-review clicks. Do not narrate every row. The audience needs to see the input, the decision and the updated result. If running late, omit the deliberate wrong-owner selection.

20:00-23:00 · PAGE 8, THEN PAGE 3

Build 3: a finding reaches the next person.

JOSH CLICKS Select Nina. Inspect the original source. Record Nina’s review. Assign Nina, set the date and share. Stop clicking when all three recipient panels update.

JOSH Nina’s team has a useful finding. The first step is evidence: this original case says the receiving owner was missing. Nina reviews what the case actually supports before publishing a finding.

JOSH Now we assign the follow-up and a next-update date. Watch the three views together.

JOSH Nina sees the reviewed finding in Teams. Marcus sees it attached to the Northwind account. Leah sees the issue, accountable owner and next update in the weekly briefing. Nina is to confirm the receiving Service owner, with an update due Tuesday, November 10.

JOSH The customer issue is still open. We have made the evidence and next action visible to the people who need them. Leah does not need to send another request to find out who owns it.

SUUCHI The important change is what each person can do next. Marcus has context for the account. Leah has an accountable follow-up. Nina has an explicit action. The reviewed business record travels with those decisions.

JOSH CLICKS Click 03 The company, then After Nine-67. Reveal Priya, Elena and Nina one at a time using the improvement selector. Leave Nina selected.

JOSH The people stay in the same positions. The company-wide picture changes one improvement at a time.

JOSH Priya’s method becomes a supported workflow another branch can use. Elena gets a guided review with a human decision. Nina’s finding reaches an account record and the leadership briefing.

JOSH Three different improvements. Each starts with how someone actually works. Each makes the next person’s job easier.

Optional only: Review supporting cases. The live path publishes the reviewed CASE-201 finding. Do not claim that seven cases or all eight candidates were reviewed in this sequence.

23:00-25:00 · PAGE 9

Make the first engagement concrete.

JOSH CLICKS Click 09 Start here. Leave this page visible through Q&A.; Do not open a booking dialog unless you want to show the chat invitation.

JOSH What we are offering starts with a company-wide AI workflow assessment and a prioritized build plan.

JOSH We discover how AI is actually being used, where employees have created something valuable, where people need a better way to do their work, and where the next person still has to chase information.

JOSH Then we prioritize with leadership. The first implementation gets a defined scope, a business owner, approved sources, review points and a success measure. We build and pilot it with the people who will use it, then measure what changed before expanding.

SUUCHI And the first recommendation does not always have to be a large build. Sometimes it is sharing Ben’s method. Sometimes it is supporting what Priya already created. Sometimes it is building a guided workflow or connecting a reviewed finding across departments.

SUUCHI Josh, who should people bring to the first conversation?

JOSH Bring the person responsible for operations, someone from IT, and two department leaders whose teams depend on each other. Ask each to bring one example where AI helps and one piece of work their people still have to chase.

JOSH If that sounds like your company, type “discovery” in the chat. We’ll arrange the complimentary workflow assessment conversation included for attendees, separately after the webinar, and clarify the scope and next steps with you.

JOSH Let’s take your questions. Suuchi, I’ll start with what’s coming through in the chat.

Offer wording matches the webinar invitation: a complimentary assessment scheduled separately. Do not promise a free implementation, a fixed delivery date or measured savings from this illustrative demo.

25:00-29:00 · Q&A; / 29:00-30:00 · CLOSE

Answer the question. Then land the invitation.

Use only the answers the audience asks for

JOSH · "DO WE NEED ANOTHER AI PLATFORM?" Not necessarily. We first look at the tools and useful work you already have. The right improvement might be a reusable method, a focused workspace or a connection inside existing systems.

SUUCHI · "WILL YOU READ EVERYONE'S PRIVATE AI CHATS?" No. Employees can show us useful techniques and business outputs without giving us access to private conversations. Any implementation uses approved sources and the access appropriate to the people involved.

JOSH · "HOW DO WE KNOW IT WILL PAY OFF?" We establish a baseline for the selected workflow: time spent gathering inputs, time to a usable result, rework, and whether people keep using it. Then we compare the pilot with that baseline.

SUUCHI · "HOW LONG DOES THIS TAKE?" That depends on the workflow, the systems and the review requirements. Discovery gives us the scope and access needs so we can propose a credible implementation plan.

JOSH · "IS THE DEMO LIVE?" The interactions work, but Parkside's records, AI responses and integrations are simulated. A production build would connect your authorized systems and be tested against your real work.

29:00 · Josh closes

JOSH Today you saw that "we use AI" can mean very different things inside one company. There may already be a Priya whose method is worth sharing, an Elena who needs a useful workflow, and a Leah still assembling everyone's work by hand.

JOSH That is where we start: understand the whole company, choose a practical improvement, and build it with the people doing the work. Type "discovery" in the chat if you would like to explore that with us. Thank you for spending the half hour with us.

Research and recovery notes

Miro, State of Intelligent Collaboration 2026: 83% individual productivity; 69% private sessions.
Atlassian, State of Teams 2026: 85% use AI at work; 29% embed it in workflows. Separate self-reported surveys.

If time slips: shorten Daniel and Marcus, skip optional source drawers and the wrong-owner example, and keep all three builds. **If a click stalls:** explain the expected result, use the top navigation and continue. Presenter controls > Restart clears the demonstration.
